"Characterization of PKI-gamma, a novel isoform of the protein kinase
"Characterization of PKI-gamma, a novel isoform of the protein kinase
inhibitor of CAMP-dependent protein kinase.";
- FUNCTION: EXTEMBLY BIL18 (1997).
- FUNCTION: EXTEMBLY POTENT COMPETITIVE INHIBITOR OF CAMP-DEPENDENT
- PROTEIN KINASE ACTIVITY, THIS PROTEIN INTERACTS WITH THE
CATALITIC SUBMUNT OF THE ENZYME AFTER THE CAMP-INDUCED
- DISSOCIATION OF ITS REGULATORY CHAINS (BY SIMILARITY).
- SIMILARITY: BELONGS TO THE PKI FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

J, Biol, Chem. 270:8495-8500(1995).

-1- FUNCTION: GUANINE NUCLEOTIDE-BINDING PROTEINS (G PROTEINS) ARE INVOLVED AS A MODILATOR OR TRANSBOCKER IN VARIOUS TRANSBURBANE SIGNALING SYSTEMS. THE BETA AND GAMMA CHAINS ARE REQUIRED FOR THE STRANSBORD OF STRANSBORD FOR THE BETA AND GAMMA CHAINS ARE REQUIRED FOR THE BEFORD INTERACTION.

-1- SUBLINATI G PROTEINS ARE COMPOSED OF 3 UNITS (ALPHA, BETA & GAMMA).

-1- SIMILARITY: BELONGS TO THE G PROTEIN GAMMA FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SUBUNIT: F-TYPE ATPASES HAVE 2 COMPONENTS, CF(1) - THE CATALYTIC CORE - AND CF(0) - THE MEMBRANE PROTON CHANNEL. CF(1) HAS FIVE SUBUNITS: ALPHA(3), BETA(3), GAMMA(1), DELTA(1), EPSILON(1). CF(0) HAS THREE MAIN SUBUNITS: A, B AND C. SIMILARITY: BELONGS TO THE ATPASE C CHAIN FAMILY.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 22,

Patent No. 6066472
GENERAL INFORMATIONE
APPLICANT: GONES, LEONEL JORGE
APPLICANT: CLAESSON WELSH, LENA
APPLICANT: HELDIN, CARL-HENRIK
TITLE OF INVENTION: PRIMARY STRUCTURE AND FUNCTIONAL
APPLICANT: ZIMMET, PAUL Z.
APPLICANT: COLLIER, GREGORY
TITLE OF INVENTION: A NOVEL GENE AND USES THEREFOR
FILE REFERENCE: 22975-20007.00
CURRENT APPLICATION WUMBER: US/09/331,930A
CURRENT APPLICATION WUMBER: PCT/AU98/00902
PRIOR APPLICATION WUMBER: PCT/AU98/00902
PRIOR APPLICATION WUMBER: AU PP0117/97
PRIOR APPLICATION WUMBER: AU PP013/97
PRIOR FILING DATE: 1997-10-31
PRIOR FILING DATE: 1997-11-11
NUMBER OF SEQ ID NOS: 27

B18937-64 represent the PIR (phosphorylated insulin receptor interacting region) or PIR-SH2 (Src homology 2) domains of a Grb7 family protein. PIR is the actual binding region but its effect is about 10 times greater in presence of SH2 (which by itself is inactive). Agents that affect binding between the peptides and the insulin receptor can peptides are used for screening molecules for ability to treat diseases in which insulin is implicated. The peptides are used to identify agents that are potentially useful for treating insulin-associated diseases that are potentially useful for treating insulin-associated diseases and syndrome X.
                                              Fragments of Grb family proteins to identify compounds are useful in treating insulin-associated diseases, particularly diabetes and obesity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Phosphorylated insulin receptor interacting region; Grb? family protein; insulin receptor; tyrosine kinase; insulin; insulin-associated disease; diabetes; obesity; polycystic ovarian syndrome; syndrome X.

B18937-64 represent the PIR (phosphorylated insulin receptor interacting region) or PIR-SH2 (Src homology 2) domains of a Grb7 family protein. PIR is the actual binding region but its effect is about 10 times greater in presence of SIGN which by itself is inactive). Agents that affect binding between the peptides and the insulin receptor can stimulate or inhibit tyrosine Kinase activity of the receptor. The peptides are used for screening molecules for ability to treat diseases in which insulin is implicated. The peptides are used to identify agents that are potentially useful for treating insulin-associated diseases, and syndrome X.
stimulate or inhibit tyrosine kinase activity of the receptor. The peptides are used for screening molecules for ability to treat diseases in which insulin is implicated. The peptides are used to identify agents that are potentially useful for treating insulin-associated diseases, particularly diabetes and obesity but also polycystic ovarian syndrome and syndrome X.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Phosphorylated insulin receptor interacting region; Grb7 family protein; insulin receptor; tyrosine kinase; insulin; insulin-associated disease; diabetes; obesity; polycystic ovarian syndrome; syndrome X_{\rm c}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Fragments of Grb family proteins to identify compounds are useful in treating insulin-associated diseases, particularly diabetes and obesity

B18937-64 represent the PIR (phosphorylated insulin receptor interacting region) or PIR-SH2 (Src homology 2) domains of a Grb7 family protein. PIR is the actual binding region but its effect is about 10 times greater in presence of SH2 (which by itself is inactive). Agents that affect binding between the peptides and the insulin receptor can peptides are used for screening molecules for ability to treat diseases in which insulin is implicated. The peptides are used for screening molecules for ability to treat diseases in which insulin is implicated. The peptides are used to identify agents that are potentially useful for treating insulin-associated diseases, particularly diabetés and obesity but also polycystic ovarian syndrome
                                                                                                                                                                                                                            protein;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Fragments of Grb family proteins to identify compounds are useful in treating insulin-associated diseases, particularly diabetes and obesity
                                                                                                                                                                                                                        Phosphorylated insulin receptor interacting region; Grb7 family protein; insulin receptor; tyrosine kinase; insulin; insulin-associated disease; diabetes; obesity; polycystic ovarian syndrome; syndrome X.

Phosphorylated insulin receptor interacting region; Grb7 family protein; insulin receptor; tyrosine kinase; insulin; insulin-associated disease; diabetes; obesity; polycystic ovarian syndrome; syndrome X.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 B18937-64 represent the PIR (phosphorylated insulin receptor interacting region) or PIR-SH2 (Src homology 2) domains of a Grb7 family protein. First the actual binding region but its effect is about 10 times greater in presence of SH2 (which by itself is inactive). Agents that stimulate or inhibit tyrosine kinase activity of the receptor can peptides are used for screening molecules for ability to treat diseases in which insulin is implicated. The peptides are used to identify agents that that are potentially useful for treating insulin-associated diseases particularly diabetes and obesity but also polycystic ovarian syndrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ó

B18937-64 represent the PIR (phosphorylated insulin receptor interacting region) or PIR: SH2 (Src homology 2) domains of a Grb7 family protein. PIR is the actual binding region but its effect is about 10 times greater in presence of SH2 (which by itself is inactive). Agents that affect binding between the peptides and the insulin receptor can peptides are used for screening molecules for ability to treat diseases in which insulin is implicated. The peptides are used to identify agents particularly dispetes and obesity but also polycystic ovarian syndrome and syndrome X.
                                                                    Fragments of Grb family proteins to identify compounds are useful in treating insulin-associated diseases, particularly diabetes and obesity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Phosphorylated insulin receptor interacting region; Grb7 family protein; insulin receptor; tyrosine kinase; insulin; insulin-associated disease; diabetes; obesity; polycystic ovarian syndrome; syndrome x.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   B18937-64 represent the PIR (phosphorylated insulin receptor interacting region) or PIR-SH2 (Src homology 2) domains of a Grb7 family protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Fragments of Grb family proteins to identify compounds are useful in treating insulin-associated diseases, particularly diabetes and obesity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0; Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            B18937-64 represent the PIR (phosphorylated insulin receptor interacting region) or PIR-SHZ (Src homology 2) domains of a Grb7 family protein. PIR SHZ (FRY EAGL OF PART OF THE SHZ (FRILLY PROTEIN.) PIR is the actual binding region but its effect is about 10 times greater in presence of SHZ (which by itself is inactive). Agents that affect binding between the peptides and the insulin receptor can peptides are used for screening molecules for ability to treat diseases in which insulin is implicated. The peptides are used to identify agents that are potentially useful for treating insulin-associated diseases, particularly diabetes and obesity but also polycystic ovarian syndrome
PIR is the actual binding region but its effect is about 10 times greater in presence of SH2 (which by itself is inactive). Agents that affect binding between the peptides and the limslin receptor can stimulate or inhibit tyrosine kinase activity of the receptor. The peptides are used for screening molecules for ability to treat diseases in which insulin is implicated. The peptides are used to identify agents that are potentially useful for treating insulin-associated diseases, particularly diabetes and obesity but also polycystic ovarian syndrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Phosphorylated insulin receptor interacting region; Grb7 family protein; insulin receptor; tyrosine kinase; insulin; insulin-associated disease; diabetes; obesity; polycystic ovarian syndrome; syndrome X.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Fragments of Grb family proteins to identify compounds are useful in treating insulin-associated diseases, particularly diabetes and obesity

PIR: st the actual binding region but its effect is about 10 times greater in presence of SH2 (which by itself is inactive). Agents that affect binding between the peptides and the insulin receptor can stimulate or inhibit tyrosine kinase activity of the receptor. The peptides are used for screening molecules for ability to treat diseases in which insulin is implicated. The peptides are used to identify agents that are potentially useful for treating insulin-associated diseases, particularly diabetes and obesity but also polycystic ovarian syndrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Phosphorylated insulin receptor interacting region; Grb7 family protein; insulin receptor; tyrosine kinase; insulin; insulin-associated disease; diabetes; obesity; polycystic ovarian syndrome; syndrome X.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Fragments of Grb family proteins to identify compounds are useful in treating insulin-associated diseases, particularly diabetes and obesity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ó;
                                                                                                                                                                                                                                                                                                                                                                                                                                Peptide derived from the PIR or PIR-SH2 domain of Grb7 protein.

B18937-64 represent the PIR (phosphorylated insulin receptor interacting region) or PIR:5H2 (src homology 2) domains of a Grb7 family protein. PIR is the actual binding region but its effect is about 10 times affect in presence of SH2 (which by itself is inactive). Agents that affect binding between the peptides and the insulin receptor can peptides are used for screening molecules for ability to treat diseases in which insulin is implicated. The peptides are used to identify agents that are potentially useful for treating insulin-associated diseases that are potentially useful for treating insulin-associated diseases, and syndrome X.
                                                                                                                                                                               Fragments of Grb family proteins to identify compounds are useful in treating insulin-associated diseases, particularly diabetes and obesity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Phosphorylated insulin receptor interacting region; Grb7 family protein; insulin receptor; tyrosine kinase; insulin; insulin-associated disease; diabetes; obesity; polycystic ovarian syndrome; syndrome x.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Fragments of Grb family proteins to identify compounds are useful in treating insulin-associated diseases, particularly diabetes and obesity

Freiend actual binding region but its effect is about 10 times affect binding between the peptides and the insulin receptor can stimulate or inhibit tyrosine kinase activity of the receptor can peptides are used for screening molecules for ability to treat diseases the which insulin is implicated. The peptides are used to dentify agents that are potentially useful for treating insulin-associated diseases that are potentially useful for treating insulin-associated diseases, and syndrome X.
                                     Phosphorylated insulin receptor interacting region; Grb7 family protein, insulin receptor; tyrosine kinase; Insulin; insulin-associated disease; diabetes; obesity; polycystic ovarian syndrome; syndrome X.
                                                                                                                                                                                                                                                                                                                                                                                                                  Fragments of Grb family proteins to identify compounds are useful in treating insulin-associated diseases, particularly diabetes and obesity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Phosphorylated insulin receptor interacting region; Grb7 family protein; insulin receptor; tyrosine kinase; insulin; insulin-associated disease; diabetes; obesity; polycystic ovarian syndrome; syndrome x.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                         Burnol A, Perdereau D, Kasus-Jacobí A, Berezlat V, Girard J;
Peptide derived from the PIR or PIR-SH2 domain of Grb7 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Peptide derived from the PIR or PIR-SH2 domain of Grb7 protein.

B18937-64 represent the PIR (phosphorylated insulin receptor interacting region) or PIR-SH2 (Src homology 2) domains of a Grb7 family protein. PIR is the actual binding region but its effect is about 10 times greater in presence of SH2 (which by itself is inactive). Agents that affect binding between the peptides and the insulin receptor can stimulate or inhibit tyrosine Kinase activity of the receptor. The peptides are used for screening molecules for ability to treat diseases in which insulin is implicated. The peptides are used to identify agents that are potentially useful for treating insulin-associated diseases, particularly diabetes and obesity but also polycystic ovarian syndrome X.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          B18937-64 represent the PIR (phosphorylated insulin receptor interacting region) or PIR-SIZ (Src homology 2) domains of a Grb7 family protein. PIR is the actual binding region but its effect is about 10 times preater in presence of SIZ (which by itself is inactive). Agents that affect binding between the peptides and the insulin receptor can stimulate or inhibit tyrosine kinase activity of the receptor. The peptides are used for screening molecules for ability to treat diseases in which insulin is implicated. The peptides are used to identify agents that are potentially useful for treating insulin-associated diseases, and syndrome X.

PIR is the actual binding region but its effect is about 10 times to agreater in presence of SIV (which by itself is inactive). Agents that affect binding between the peptides and the insulin receptor can peptides are used for screening molecules for ability to treat diseases in which insulin is simplicated. The peptides are used to identify agents that are potentially useful for treating insulin. Simplicated and obesity but also polycystic ovarian syndrome
                                                                                                                                                                                                                                                                                               Phosphorylated insulin receptor interacting region; Grb7 family protein; insulin receptor; tyrosine kinase; insulin; insulin-associated disease; diabetes; obesity; polycystic ovarian syndrome, syndrome X.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Fragments of Grb family proteins to identify compounds are useful in treating insulin-associated diseases, particularly diabetes and obesity

The present invention describes substantially purified human proteins

C (referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1)

to the specification). ABM15/62 to ABM27552 encode the human ORFX

in the specification). ABM15/62 to ABM27552 encode the human ORFX

c retains given in ABP00101 to ABM127552 encode the human ORFX

c retains given in ABP00101 to ABM15/65 encode the human ORFX

c retains given in ABP00101 to ABM15/65 encode the human ORFX

c specimens or preventing a pathology associated with an ORFX-associated

c specimen or preventing a pathology associated with an ORFX-associated

c syndrome associated with ORFX-associated disorder. ORFX polynucleotide

c streatment of cancer, hyperproliferative disorders, cirrhosis of liver,

c psoriasis, benign tumours, keloid, degenerative disorders; haemorrhage,

c transplantation, cardiovascular disoases, disorders related to organ

c transplantation, cardiovascular diseases, disorders, infectious

c transplantation, cardiovascular diseases, disorders, infectious

c transplantation, avarious immune deficiencies and disorders, infectious

carthritis, autoimmune disorders such as multiple sclerosis, theumatoid

disease and autoimmune infimamatory eye disease. ORFX proteins are also

c bone degenerative disorders, or periodontal disease, and for gut

renerfusion intimative in various intensions and constitute for the constitution and treatment of lung or liver fiberosis,

c renerfusion intimation and treatment of lung or liver fiberosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            reperfusion injury in various tissues and conditions resulting from systemic cytokine damage.

The invention relates to novel human secreted polypeptides. The polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents also useful for identifying a part and antagonists) that bind to them. Cells of or use in treatment of a pathology related to aberran expression or physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptide. Vectors comprising the nucleic acids encoding the polypeptide and earls genetically comprised to express them are also useful for producing the proteins are useful in genetic vaccination, testing and cincrase stem cell proliferation; to regulate haematopoiesis: and in increase stem cell proliferation; to regulate haematopoiesis; and in the timmune suppression and/or atimulation; as anti-inflammatory agents; and conclusion in treatment of leukaemias. AAU79510-AAU33304 represent the amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                        Nucleic acids encoding a range of human polypeptides, useful in genetic vaccination, testing and therapy -

ANH32943 to AAH37195 and AAG73514 to AAG77788 represent human colon cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene the colon cancer antigens have cytostatic activity and can be used in gene the colon cancer antigens have cytostatic activity and can be used in gene prevention, color cangers and treatment of diseases associated with happropriate P compared and treatment of diseases associated with nappropriate P color cancer associated with decreased expression rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing including anticular proteins or to supplement the patients own production of P. Color cancer associated Ps. Color cance

The present invention describes substantially purified human proteins (referred to as open reading frame, ORRY, where X is 1-11491 (see Table 1 in the specification). ABN15762 to ABN27252 encode the human ORRX proteins are useful for proteins given in ABP00101 to ABP11500. ORFX proteins are useful for treating or preventing a pathology associated with an ORRY-associated disorder. ORFX polynucleotide syndrome associated with Rora-associated disorder. ORFX polynucleotide syndrome associated with Rora-associated disorder. ORFX polynucleotide sequences can be used in gene therapy. ORFX sequences can be used in the creatment of cancer, hyperproliferative disorders, cirrhosis of liver, psoriasis, benign tumours, keloid, degenerative disorders, cirrhosis of liver, psoriasis, benign tumours, keloid, degenerative disorders, in the carecarthritis, meurodegenerative disorders, disorders, infectious storage disease, various immune deficiencies and disorders, infectious diseases, autolimmune disorders such as multiple sclerosis, rheumatoid arthritis, autolimmune thyroiditis, myssthenia gravis, graft-versus-host consequential pourns, incisions, ulcers, for treating osteoporosis, consequential diseases, and for gut consequential diseases. An one degenerative disorders, or periodontal disease, and for gut consequential diseases, and for gut consequential diseases, and for gut consequential diseases, and for gut consequential disease, and disorders in perfusion or regeneration and treatment of lung or liver fibrosis, consequential diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Systemic cytokine damage.
N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO and fite.int/pub/published_pct_sequences.

Spatially-addressable set of single exon nucleic acid probes, used to measure gene expression in human lung samples -Claim 27; SEQ ID No 36931; 634pp; English.

The Invention relates to a spatially-addressable set of single exon cucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one of from human lung comprising the acid probes having one of probes. Also included are a microarray comprising the novel set of probes; the novel set of probes which hybridise at thigh stringency to a collection of detectably labeled mucleic acid expression in a collection of detectably labeled nucleic acids derived from human lung, comprising of a collection of detectably labeled nucleic acids derived from human lung, comprising of a collection of detectably labeled nucleic acids derived from human lung comprising of a collection of detectably labeled nucleic acids derived from human lung comprising of a collection of detectably labeled nucleic acids derived from human lung collection of detectably bound to each probe of the array; identifying exons in a eukaryotic acids derived from human lung collection at least one exon from genomic sequences of the eukaryote; and (b) detecting at least one exon from genomic sequences and algorithmically predicting at least one exon from genomic sequences contributed above mentioned microarray; assigning exons to a single exon probe, in the above mentioned microarray; assigning exons in a single exon in several expression of the exons in the tissues and/or cell types using phybridisation to a single exon in expression of the exons in the tissues and/or cell types using phybridisation to a single exon for the exons in the tissues and/or cell types using phybridisation or encoded by the exons and an analysis and for the probes are used for gene correct probes/open reading frames (ORF). The probes are used for gene where such as asthma, lung derived mank and for the study of lung derived mank and for the study of lung are seen common particularly such as asthma, lung derived mank and for the study of lung parent characterizing the services and particularly sequences.

3 Niemann-Pick disease, Hermansky-Pudlak syndrome, sarcoidosis, pulmonary pulmonary alveolar proteinosis, lymphangioleiomyomtosis, pulmonary alveolar proteinosis, Karagener syndrome, fibrocystic and hyaline membrane disease. The present sequence is a peptide/protein Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic fip. who.int/pub/published_pct_sequences. Human; 5' EST; expressed sequence tag; secreted protein; cDNA isolation; gene therapy; chromosome mapping. Gaps The present sequence is a polypeptide encoded by one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly, to the 3' iron oilso-dr primed CDNA libraries. Such ESTs are not well sulted for those cases where longer cDNA sequences have been obtained isolating cDNA sequences have been obtained, the full 5' ends of mRNAs and even in Those cases where longer CDNA sequences have been obtained, the full 5' ends and can therefore be used to obtain full length cDNAs with intext 5' DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and requilatory sequences. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors. New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures 7; Indels 26; 17 GOKSRVIENP------EEGLAWRKK 43 11 GOKARLLSRPLRGVSGKHCLTFFYHMYGGGTGLLSVYLKKEEDSEESLLWRRR 63 21.2%; Score 45; DB 23; Length 84; 26.4%; Pred. The invention describes an isolated nucleic acid molecule (1) encoding a novel central nervous system protein. (1) and polypeptides (III) encoded by (I), are used to treat a medical conditions and in diagnosis of a pathological condition. But are diagnosed or treated include the diagnosed or treated include attoinment diseases e.g. rheumatoid arthritis, hyperproliferative cardiomases e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. Alzhehmer's disease and anylotrophic lateral sclerosis, infections caused by bacteria, viruses c.g. Acquired immunodeficiency virus (AIDS) and fund, coular disorders e.g. denocarcinomas and irritable bowel syndrome, reproductive system of principal disorders e.g. dysphagia, adenocarcinomas and irritable bowel syndrome, reproductive system of pituitary dwarfism, cancers and disorders e.g. diabetes and pituitary dwarfism, cancers and disorders e.g. malignancies, claukeamia, disorders involving neovascularisation e.g. malignancies, crespiratory disorders involving neovascularisation e.g. mycoarders e.g. cute kidney failure and blood related disorders e.g. mycoarders e.g. cute kidney failure and blood related disorders e.g. mycoarders e.g. mycoardial cell proliferation, to prevent skin aging due to sumbrun, to primary tissues, to regenerate tissues and in chemicaxis. The primary tissues, to regenerate tissues and in chemicaxis. The primary tissues or decrease storage capabilities, fat content, lipid, protein,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Quèry Match 21.0%; Score 44.5; DB 22; Length 74;

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic to the treatment, prevention and their associated DNA sequences are used in the treatment, prevention and dagnosis of medical conditions caused in pustulosis, hypertosis and osteomyclitis) weelts and endophthalmitis.

CC acnes is also involved in infections of bone, joints and endophthalmitis. nervous system, however it is particularly involved in the inflammatory presence or absence of p. acnes in a patient comprises contacting to sample with a binding agent that binds to the protein of an entrail cc and determining the amount of bound protein in the sample. The polypeptides may be used as antiquent in the sample. The downregulate expression and activity of P. acnes production of antibodies can be used to downregulate expression and activity of P. acnes production of antibodies can be used to downregulate expression and activity of P. acnes productions of antibodies and catagents for determining P. acnes infections. The antibodies can be used as naminal activity of P. acnes production as any also be used as consigning the across infections. The antibodies can be used as consigned immunosorbent assay (ELISA).

CC and determining P. acnes infections. The antibodies can be used as consigning the across that across the production and activity of P. acnes production as any also be used as consigning the across that across presence, for example, by specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                  SAPHO syndrome, synovitis; acne, pustulosis; hypertosis; osteomyelitis; inflammatcry lesion; acne vulgaris; enzyme linked system; Elish, dermatological; osteopathic; neuroprotectant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                3; Gaps

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic complete treatment, prevention and diagnosts of medical conditions caused in the treatment, prevention and diagnosts of medical conditions caused by acnes. The disorders include SAHO syndrome (synovitis, acne, practions, hypertosis and osteomyelitis), uveitis and endophthalmits. CC new constraints in infections of bone, Johns and the central presence or absence of p. acnes ungaris. A method for detecting the presence or absence of p. acnes in a patient comprises contacting a polypeptides may be used as antigens in the proteins of the invention of specific for P. acnes proteins. These antibodies can be used to downsqulate expression and activity of P. acnes polypeptides and contacting a polypeptides may be used as antigens in the production of antibodies can be used to downsqulate expression and activity of P. acnes polypeptides and carry in the sequence acts for example, by specification, but was obtained in electronic format directly from WIPO.
                                                                                  SAPHO syndrome, synovitis, acne, pustulosis, hypertosis; osteomyelltis; endophthalmitis; bone, joint, central nervous system; ELISA, inflammatcry lesson, acne vulgaris; enzyme linked immunosorbent assay; dermatological; osteopathic; neuroprotectant.
                                                                                                                                                                                                                                                                                                                                                                                                                                               Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful for treating acne vulgaris
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The present invention provides the protein and coding sequences of a number of human reproductive system related antigens. These can be used in the prevention and treatment of reproductive system disorders, including cancer. The present sequence is a protein of the invention.
                                                                                                                                                                                                                                                                                                                                                             Isolated nucleic acid molecule encoding a reproductive system antigen is used in preventing, treating or ameliorating a medical condition -
                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 11; SEQ ID NO 3024; 1297pp + Sequence Listing; English.
